

JEPPIAAR ENGINEERING COLLEGE

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

CS8351- DATA STRUCTURES Question Bank

II YEAR A & B / BATCH: 2017 -21

Vision of Institution

To build Jeppiaar Engineering College as an Institution of Academic Excellence in Technical education and Management education and to become a World Class University.

Mission of Institution

M1	To excel in teaching and learning, research and innovation by promoting the
	principles of scientific analysis and creative thinking
M2	To participate in the production, development and dissemination of knowledge and
	interact with national and international communities
M3	To equip students with values, ethics and life skills needed to enrich their lives and
	enable them to meaningfully contribute to the progress of society
M4	To prepare students for higher studies and lifelong learning, enrich them with the
	practical and entrepreneurial skills necessary to excel as future professionals and
	contribute to Nation's economy

Program Outcomes (POs)

0	
PO1	Engineering Knowledge : Apply the Knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of
	complex engineering problems.
	Problem analysis : Identify, formulate, review research literature, and analyze
PO2	complex engineering problems reaching substantiated conclusions using first
	principles of mathematics, natural sciences, and engineering sciences.
	Design/development of solutions : Design solutions for complex engineering
PO3	problems and design system components or processes that meet the specified
103	needs with appropriate consideration for the public health and safety, and the
	cultural, societal, and environmental considerations
	Conduct investigations of complex problems: Use research-based Knowledge
PO4	and research methods including design of experiments, analysis and interpretation
	of data, and synthesis of the information to provide valid conclusions.
	Modern tool usage: Create, select, and apply appropriate techniques, resources,
PO5	and modern engineering and IT tools including prediction and modeling to
	complex engineering activities with an understanding of the limitations.
	The engineer and society: Apply reasoning informed by the contextual
PO6	Knowledge to assess societal, health, safety, legal and cultural issues and the
	consequent responsibilities relevant to the professional engineering practice.
	Environment and sustainability: Understand the impact of the professional
PO7	engineering solutions in societal and environmental contexts, and demonstrate the
	Knowledge of, and need for sustainable development.
DO0	Ethics: Apply ethical principles and commit to professional ethics and
PO8	responsibilities and norms of the engineering practice.

PO9	Individual and team work : Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.			
PO10	Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.			
PO11	Project management and finance : Demonstrate Knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.			
PO12	Life-long learning : Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.			

Vision of Department

To emerge as a globally prominent department, developing ethical computer professionals, innovators and entrepreneurs with academic excellence through quality education and research.

Mission of Department

M1	To create computer professionals with an ability to identify and formulate the
	engineering problems and also to provide innovative solutions through effective
	teaching learning process.
MO	
M2	To strengthen the core-competence in computer science and engineering and to create
	an ability to interact effectively with industries.
M3	To produce engineers with good professional sKills, ethical values and life skills for the
	betterment of the society.
M4	To encourage students towards continuous and higher level learning on technological
	advancements and provide a platform for employment and self-employment .

Program Educational Objectives (PEOs)

PEO1	To address the real time complex engineering problems using innovative approach				
	with strong core computing skills.				
PEO2	To apply core-analytical Knowledge and appropriate techniques and provide solutions to real time challenges of national and global society				
PEO3	Apply ethical Knowledge for professional excellence and leadership for the betterment of the society.				
PEO4	Develop life-long learning skills needed for better employment and entrepreneurship				

SYLLABUS

UNIT I LINEAR DATA STRUCTURES-LIST

9

Abstract Data Type (ADT) - List ADT- Arrays based Implementation-linked list implementation-singly linked lists-circularly linked lists-doubly linked list-Application of list-polynomial manipulation-all operations (insertion, deletion, merge, traversal).

UNIT II LINEAR DATA STRUCTURES-STACKS, QUEUES

9

Stack ADT-Operations-applications-Evaluating arithmetic expressions-conversion of infix to postfix expressions-queue ADT-Operations-circular queue-priority queue-dequeue-applications of queues.

UNIT III NON LINEAR DATA STRUCTURES- TREES

9

Tree ADT-tree traversals-Binary Tree ADT-expression Trees-applications of Trees-Binary search tree ADT-Threaded binary Tree-AVL Tree-B+Tree-Heap-Applications of Heap.

UNIT IV NON LINEAR DATA STRUCTURES- GRAPHS

9

Definition-Representation of graph-types of graph-Breadth-first traversal-Depth-first-Traversal-Topological sort-Bi-connectivity-Cut vertex-Eulercircuits-Applications of graphs.

UNIT V SEARCHING, SORTING AND HASHING TECHNIQUES

9

Searching –Linear searching-Binary searching. Sorting-Bubble sort-selection Sort-Insertion Sort-shell sort-Radix Sort. Hashing-Hash functions-Separate chaining-Open Addressing-Rehashing- Extendible hashing.

Course Outcomes (COs)

C203.1	Implement abstract data type for List linear data structure and apply them to problem solutions.
C203.2	Implement abstract data type for Stack and Queue linear data structure and apply them to problem solutions.
C203.3	Implement abstract data type for Tree non List linear data structure and apply them to problem solutions.
C203.4	Implement abstract data type for Graph non List linear data structure and apply them to problem solutions.
C203.5	Analyze the various sorting and Searching algorithms and Hashing Techniques.

BLOOM TAXANOMY LEVELS

BTL6: Creating BTL 5: Evaluating BTL 4: Analyzing BTL 3: Applying BTL 2: Understanding BTL 1: Remembering

UNIT I

LINEAR DATA STRUCTURES-LIST

Abstract Data Type (ADT) - List ADT- Arrays based Implementation-linked list implementation-singly linked lists-circularly linked lists-doubly linked list-Application of list-polynomial manipulation-all operations (insertion, deletion, merge, traversal).

S. No.	Question		Blooms Taxanom y Level
1	 What is a data structure? A data structure is a method for organizing and storing data which would allow efficient data retrieval and usage. A data structure is a way of organizing data that considers not only the items stored, but also their relationships to each other. 	C203.1	BTL1
2	 Why do we need data structures? Data structures allow us to achieve an important goal: component reuse. Once data structure has been implemented, it can be used again and again in various applications. 	C203.1	BTL 1
3	List some common data structures.	C203.1	BTL 1
4	How data structures are classified? Data structures are classified into two categories based on how the data items are operated: i. Primitive data structure ii. Non-Primitive data structure	C203.1	BTL 1

	a. Linear data structure b. Non-linear data structure			
5	Differentiate linear and non-linear data structure.			
	Linear data structure	Non-linear data structure		
	Data are arranged in linear or sequential manner	Data are not arranged in linear manner		BTL 2
	Every items is related to its previous and next item	Every item is attached with many other items		
	Data items can be traversed in a single run.	Data items cannot be traversed in a single run.		
	Implementation is easy Example: array, stack, queue, linked list	Implementation is difficult. Example: tree, graph		
6	Define ADT (Abstract Data Type) An abstract data type (ADT) is a set of operations and mathematical abstractions, which can be viewed as how the set of operations is implemented. Objects like lists, sets and graphs, along with their operation, can be viewed as abstract data types, just as integers, real numbers and Booleans.			BTL 1
7	Mention the features of ADT. a. Modularity i. Divide program into small functions ii. Easy to debug and maintain iii. Easy to modify b. Reuse i. Define some operations only once and reuse them in future c. Easy to change the implementation			BTL 2
8	Define List ADT A list is a sequence of zero or more elements of a given type. The list is represented as sequence of elements separated by comma. A1, A2, A3AN Where N>0 and A is of type element			BTL 1
9	What are the ways of implementing linked list? The list can be implemented in the following ways: i. Array implementation ii. Linked-list implementation			BTL 1

	iii. Cursor implementation		
10	What are the types of linked lists? There are three types i. Singly linked list ii. Doubly linked list iii. Circularly linked list	C203.1	BTL 1
11	How the singly linked lists can be represented? How the singly linked lists can be represented? How the singly linked lists can be represented? A P P Inull data next Each node has two elements i. Data ii. Next	C203.1	BTL 1
12	How the doubly linked list can be represented? head prev data next Doubly linked list is a collection of nodes where nodes are connected by forwarded and backward link. Each node has three fields: 1. Address of previous node 2. Data 3. Address of next node.	C203.1	BTL 1
13	What are benefits of ADT? a. Code is easier to understand b. Implementation of ADT can be changed without requiring changes to the program that uses the ADT	C203.1	BTL 1
14	When singly linked list can be represented as circular linked list? In a singly linked list, all the nodes are connected with forward links to the next nodes in the list. The last node has a next field, NULL. In order to implement the circularly linked	C203.1	BTL 1

15	lists from singly linked lists, the last node's next field is connected to the first node. When doubly linked list can be represented as circular linked list? In a doubly linked list, all nodes are connected with forward and backward links to the next and previous nodes respectively. In order to implement circular linked lists from doubly linked lists, the first node's previous field is connected to the last node and the		
	last node's next field is connected to the first node.	C203.1	BTL 1
16	Where cursor implementation can be used? The cursor implementation of lists is used by many languages such as BASIC and FORTRAN that do not support pointers. The two important features of the cursor implementation of linked are as follows: • The data are stored in a collection of structures. Each structure contains data and a index to the next structure. • A new structure can be obtained from the system's global memory by a call to cursorSpace array.	C203.1	BTL 1
17	List down the applications of List. a. Representation of polynomial ADT b. Used in radix and bubble sorting c. In a FAT file system, the metadata of a large file is organized as a linked list of FAT entries. d. Simple memory allocators use a free list of unused memory regions, basically a linked list with the list pointer inside the free memory itself.	C203.1	BTL 1
18	What are the advantages of linked list? a. Save memory space and easy to maintain b. It is possible to retrieve the element at a particular index c. It is possible to traverse the list in the order of increasing index.	C203.1	BTL 1

	d. It is possible to change the element at a particular index to a different value, without affecting any other elements.				
19	Mention the demerits of linked list a. It is not possible to go backwards through the list b. Unable to jump to the beginning of list from the end.			C203.1	BTL 2
20	The polynomial equation can be represented with linked list as follows:				BTL 2
	Coefficient	Exponent	Next node link		
	struct polynomial { int coefficient;int ex };	ponent;struct poly	nomial *next;		
21	What are the operations performed in list? The following operations can be performed on a list i. Insertion a. Insert at beginning b. Insert at end c. Insert after specific node d. Insert before specific node ii. Deletion a. Delete at beginning b. Delete at end c. Delete after specific node d. Delete before specific node iii. Merging iv. Traversal				BTL 1
22	 What are the merits and demerits of array implementation of lists? Merits Fast, random access of elements Memory efficient – very less amount of memory is required Demerits Insertion and deletion operations are very slow since the elements should be moved. Redundant memory space – difficult to estimate the size of array. 				BTL 1
23	What is a circular A circular I supports traversing of the list to the begthe head of the list.	C203.1	BTL 1		

24	What are the advantages in the array implementation of list? a. Print list operation can be carried out at the linear time b. Find Kth operation takes a constant time	C203.1	BTL 1
25	What is the need for the header? Header of the linked list is the first element in the list and it stores the number of elements in the list. It points to the first data element of the list.	C203.1	BTL 1
26	List three examples that uses linked list? a. Polynomial ADT b.Radix sort c.Multi lists	C203.1	BTL 1
27	List out the different ways to implement the list? 1. Array Based Implementation 2. Linked list Implementation i. Singly linked list ii. Doubly linked list iii. Cursor based linked list	C203.1	BTL 1
28	Write the routine for insertion operation of singly linked list. Void Insert (ElementType X, List L, Position P) {Position TmpCell; TmpCell=malloc(sizeof(struct Node)); if(TmpCell==NULL) FatalError("Out of space!!!"); TmpCell->Element = X; TmpCell->Next=P->Next; P->Next=TmpCell; }	C203.1	BTL 5
29	Advantages of Array over Linked List. 1. Array has a specific address for each element stored in it and thus we can access any memory directly. 2. As we know the position of the middle element and other elements are easily accessible too, we can easily perform BINARY SEARCH in array.	C203.1	BTL 5
30	Disadvantages of Array over Linked List. 1. Total number of elements need to be mentioned or the memory allocation needs to be done at the time of array creation 2. The size of array, once mentioned, cannot be increased in the program. If number of elements entered exceeds the size of the array ARRAY OVERFLOW EXCEPTION occurs.	C203.1	BTL 5

31	Advantages of Linked List over Array. 1. Size of the list doesn't need to be mentioned at the beginning of the program. 2. As the linked list doesn't have a size limit, we can go on adding new nodes (elements) and increasing the size of the list to any extent.	C203.1	BTL 5
32	 Disadvantages of Linked List over Array. Nodes do not have their own address. Only the address of the first node is stored and in order to reach any node, we need to traverse the whole list from beginning to the desired node. As all Nodes don't have their particular address, BINARY SEARCH cannot be performed 	C203.1	BTL 5
	PART-B		
1	Explain the various operations of the list ADT with examples	C203.1	BTL 2
2	Write the program for array implementation of lists	C203.1	BTL 5
3	Write a C program for linked list implementation of list.	C203.1	BTL 5
4	Explain the operations of singly linked lists	C203.1	BTL 2
5	Explain the operations of doubly linked lists	C203.1	BTL 2
6	Explain the operations of circularly linked lists	C203.1	BTL 2
7	How polynomial manipulations are performed with lists? Explain the operations	C203.1	BTL 1
8	Explain the steps involved in insertion and deletion into a singly and doubly linked list.	C203.1	BTL2

UNIT II

LINEAR DATA STRUCTURES-STACKS, QUEUES

Stack ADT-Operations-applications-Evaluating arithmetic expressions-conversion of infix to postfix expressions-queue ADT-Operations-circular queue-priority queue-dequeue-applications of queues.

S. No.	Question	Course Outcome	Blooms Taxanomy Level
1	Define Stack. A stack is an ordered list in which all insertions and deletions are made at one end, called the top. It is an abstract data type and based on the principle of LIFO (Last In First Out).	C203.2	BTL 1
2	What are the operations of the stack? a. CreateStack/ InitStack(Stack) – creates an empty stack b. Push(Item) – pushes an item on the top of the stack c. Pop(Item) – removes the top most element from the stack d. Top(Stack) – returns the first element from the stack e. IsEmpty(Stack) – returns true if the stack is empty	C203.2	BTL 1
3	Write the routine to push a element into a stack. Push(Element X, Stack S) { if(IsFull(S) { Error("Full Stack"); } else S→Array[++S→TopOfStack]=X; }	C203.2	BTL 5
4	How the operations performed on linked list implementation of stack? a. Push and pop operations at the head of the list. b. New nodes should be inserted at the front of the list, so that they become the top of the stack. c. Nodes are removed from the front(top) of the stack.	C203.2	BTL 1
5	What are the applications of stack? The following are the applications of stacks • Evaluating arithmetic expressions • Balancing the parenthesis • Towers of Hanoi • Function calls Tree traversal	C203.2	BTL 1
6	What are the methods to implement stack in C? The methods to implement stacks are: • Array based • Linked list based	C203.2	BTL 1
7	How the stack is implemented by linked list? It involves dynamically allocating memory space at run time while performing stack operations. Since it consumes only that much amount of space is required for holding its data elements, it prevents wastage of memory space. struct stack {	C203.2	BTL 1

	int element;		
	struct stack *next;		
	}*top;		
8	Write the routine to pop a element from a stack.		
0	int pop()		
	{ if(top==NULL)		
	{ ri(top==\\OLL) { printf("\n Stack is empty.\n");getch();exit(1);}	C203.2	BTL 5
	else		DIL 3
	{int temp;		
9	temp=top→element; top=top→next; return temp; }}		
9	Define queue. It is a linear data structure that maintains a list of		
		C203.2	DTI 1
	elements such that insertion happens at		BTL 1
	rear end and deletion happens at front end.		
1.0	FIFO – First In First Out principle		
10	What are the operations of a queue?		
	The operations of a queue are		
	• isEmpty()	C203.2	
	• isFull()	0203.2	BTL 1
	• insert()		
	• delete()		
	• display()		
11	Write the routine to insert a element onto a queue.		
	void insert(int element)		
	{		
	if(front==-1)		
	{		
	front = rear = front +1;		
	queue[front] = element;		
	return;		
	}	C203.2	DEL 5
	if(rear==99)		BTL 5
	{		
	printf("Queue is full");		
	getch();		
	return;		
	}		
	$\begin{vmatrix} y \\ rear = rear + 1 \end{vmatrix}$		
	queue[rear]=element;		
	quouo[rour] oromoni, }		
12	What are the types of queue?		
12	The following are the types of queue:		
	Double ended queue	C203.2	BTL 1
	=		DILI
	Circular queue Priority queue		
12	Priority queue Define devalue and devans		
13	Define double ended queue	C203.2	DTI 1
	• It is a special type of queue that allows insertion and		BTL 1
	deletion of elements at both		

	Ends.		
	It is also termed as DEQUE.		
	Deletion Insertion		
	\rightarrow		
	Insertion Deletion		
	Front Rear		
14	What are the methods to implement queue in C?		
	The methods to implement queues are:	C203.2	DEL 1
	Array based	0203.2	BTL 1
	Linked list based		
15	How the queue is implemented by linked list?		
	• It is based on the dynamic memory management techniques		
	which allow allocation and		
	De-allocation of memory space at runtime.		
	Insert operation		
	It involves the following subtasks:		
	1. Reserving memory space of the size of a queue element		
	in memory		
	2. Storing the added value at the new location	C203.2	
	3. Linking the new element with existing queue	C203.2	BTL 1
	4. Updating the <i>rear</i> pointer		
	Delete operation		
	It involves the following subtasks:		
	1. Checking whether queue is empty		
	2. Retrieving the front most element of the queue		
	3. Updating the front pointer		
	4. Returning the retrieved value		
	4. Retaining the retrieved value		
16	Write the routine to delete a element from a queue		
	int del()		
	{int i;		
	if(front == NULL) /*checking whether the queue is empty*/	C203.2	BTL 5
	{return(-9999);}		DILJ
	else		
	$\{i = front \rightarrow element; front = front \rightarrow next; return i;\}$		
	}		
17	What are the applications of queue?		
	The following are the areas in which queues are applicable		
	a. Simulation		
	b. Batch processing in an operating systems	C203.2	
	c. Multiprogramming platform systems	C203.2	BTL 1
	d. Queuing theory		
	e. Printer server routines		
	f. Scheduling algorithms like disk scheduling, CPU scheduling		
	g. I/O buffer requests		

18	Define circular queue A Circular queue is a queue whose logically connected with each other. That means the start lo location.	Front 1 2 2	C203.2	BTL 1
1)	 Push – adding an element to the Pop – removing or deleting an el 	top of stack	C203.2	BTL 1
20	What are enqueue and dequeue Enqueue - adding an element to	the queue at the rear end a function adds an element to a "OverFlow". The ent, int& rear, int arraySize) { The ent int arraySize) { The element to the back The element from the queue at the element from the element	C203.2	BTL 1
21	Distinguish between stack and q		C203.2	BTL4
	STACK	QUEUE		
	Insertion and deletion are made at one end.	Insertion at one end rear and deletion at other end front.		

	The element inserted last would be removed first. So LIFO structure. Full stack condition:	The element inserted first would be removed first. So FIFO structure. Full stack condition:		
	If(top==Maxsize)	If(rear = = Maxsize)		
	Physically and Logically full stack	Logically full. Physically may or may not be full.		
22	Convert the infix (a+b)*(c+d)/f i expression	nto postfix & prefix		
	Postfix : $ab + cd +$	* f /	C203.2	BTL5
	Prefix : / * + a b +	c d f		
23	Write postfix from of the expres	sion -A+B-C+D?		
	A-B+C-D+		C203.2	BTL5
24	How do you test for an empty queet To test for an empty queue, we has READ=HEAD where REAR is a prode in a queue and HEAD is a podummy header. In the case of array condition to be checked for an empty queue.	ve to check whether pointer pointing to the last pinter that pointer to the y implementation of queue, the	C203.2	BTL1
25	What are the postfix and prefix A+B*(C-D)/(P-R) Postfix form: ABCD-*PR-/+ Prefix form: +A/*B-CD-PR		C203.2	BTL1
26	Explain the usage of stack in recimplementation?	ack data structures is used to cursive call is encountered and	C203.2	BTL5
27	Priority queue with diagram Priority queue is a data structure following two operations. 1. Insert-inserts an element at the example 2. DeleteMin-Finds, returns and refine the priority Queue.	end of the list called the rear.	C203.2	BTL1

	CetetoMin(H) (mort(H)	<u> </u>	
	Priority Queue II		
	Operations: Insert, DeleteMin		
28	Give the applications of priority queues.		
	There are three applications of priority queues		
	1. External sorting.	C203.2	BTL3
	2. Greedy algorithm implementation.		BIL3
	3. Discrete even simulation.		
	4. Operating systems.		
29	How do you test for an empty stack?		
	To check if the stack is empty, we only need to check	C203.2	
	whether top and bottom are the same number.	C203.2	BTL1
	bool stack_empty(stack S) //@requires is_stack(S);		
2.0	{ return S->top == S->bottom; }		
30	What are the features of stacks?		
	Dynamic data structuresDo not have a fixed size		
		C202.2	
	Do not consume a fixed amount of memorySize of stack changes with	C203.2	BTL1
	each push() and pop() operation.		
	Each push() and pop() operation increases and decreases		
	the size of the stack by 1, respectively.		
31	Write a routine for IsEmpty condition of queue.		
31	If a queue is empty, this function returns 'true', else it returns		
	'false'.		
	bool isEmpty(int front, int rear) {	C203.2	
	return (front == rear);	C203.2	BTL5
	}		
	,		
	PART-B		
1	Explain Stack ADT and its operations	C203.2	BTL5
2	Explain array based implementation of stacks	C203.2	BTL5
		G202.2	7007
3	Explain linked list implementation of stacks	C203.2	BTL5
4	Explain the applications of Stacks	C203.2	BTL5
5	Explain how to evaluate arithmetic expressions using stacks	C203.2	BTL5
6	Explain queue ADT	C203.2	BTL2

10	Explain circular queue and its implementation	C203.2	BTL2
11	Explain double ended queue and its operations	C203.2	BTL2
12	Explain priority queue and its operations	C203.2	BTL5

UNIT III

NON LINEAR DATA STRUCTURES- TREES

Tree ADT-tree traversals-Binary Tree ADT-expression Trees-applications of Trees-Binary search tree ADT-Threaded binary Tree-AVL Tree-B+Tree-Heap-Applications of Heap.

S. No.	Question	Course Outcome	Blooms Taxanomy Level
1	Define non-linear data structure Data structure which is capable of expressing more complex relationship than that of physical adjacency is called non-linear data structure.	C203.3	BTL1
2	Define tree? A tree is a data structure, which represents hierarchical relationship between individual data items.	C203.3	BTL1
3	Define leaf? In a directed tree any node which has out degree o is called a terminal node or a leaf.	C203.3	BTL1
4	Explain the representations of priority queue. Using Heap structure, Using Linked List	C203.3	BTL2
5	List out the steps involved in deleting a node from a binary search tree. 1. t has no right hand child node t->r == z 2. t has a right hand child but its right hand child node has no left sub tree t->r->l == z 3.t has a right hand child node and the right hand child node has a left hand child node t->r->l!= z	C203.3	BTL1
6	Convert the infix expression (A-B/C)*(D/E-F) into a postfix. Postfix: ABC/-DE/F-*	C203.3	BTL2
7	What are the steps to convert a general tree into binary tree? * use the root of the general tree as the root of the binary tree	C203.3	BTL1

	* determine the first child of the root. This is the leftmost node in the general tree at the next		
	level		
	* insert this node. The child reference of the parent node refers		
	to this node		
	* continue finding the first child of each parent node and insert it		
	below the parent node with the		
	child reference of the parent to this node.		
	* when no more first children exist in the path just used, move		
	back to the parent of the last node		
	entered and repeat the above process. In other words,		
	determine the first sibling of the last		
	node entered. * complete the tree for all nodes. In order to legate where the		
	* complete the tree for all nodes. In order to locate where the node fits you must search for the		
	first child at that level and then follow the sibling references to		
	a nil where the next sibling can		
	be inserted. The children of any sibling node can be inserted		
	by locating the parent and then		
	inserting the first child. Then the above process is repeated.		
	What is meant by directed tree?	C203.3	
8	ed tree is an acyclic diagraph which has one node called its root	C203.3	BTL1
	with in degree o while all other nodes have in degree I.		
9	What is a ordered tree?	C203.3	
	In a directed tree if the ordering of the nodes at each level is	0200.0	BTL1
10	prescribed then such a tree is called ordered tree.		
10	What are the applications of binary tree?	G202.2	
	 Binary tree is used in data processing. File index schemes 	C203.3	BTL1
	3. Hierarchical database management system		
11	What is meant by traversing?		
	Traversing a tree means processing it in such a way, that each	C203.3	BTL1
	node is visited only once.		2121
12	What are the different types of traversing?		
	The different types of traversing are	C203.3	
	a. Pre-order traversal-yields prefix form of expression.	C203.3	BTL1
	b. In-order traversal-yields infix form of expression.		
	c. Post-order traversal-yields postfix form of expression.		
13	What are the two methods of binary tree implementation?		
	Two methods to implement a binary tree are	C203.3	BTL1
	a. Linear representation.		2111
	b. Linked representation		
14	What is a balance factor in AVL trees?		
	Balance factor of a node is defined to be the difference	C203.3	DTI 1
	between the height of the node's left subtree and the height of the	·-	BTL1
	node's right subtree.		

	nt by pivot node?		
The node to h			
	be inserted travel down the appropriate branch track	C203.3	BTL1
	y of the deepest level node on the branch that has a		
l	r of +1 or -1 is called pivot node.		
	he length of the path in a tree?	C203.3	
The length of	f the path is the number of edges on the path. In a	C203.3	BTL1
tree there is e	xactly one path form the root to each node.		
17 Define ex	pression trees?	C203.3	
eaves of an e	xpression tree are operands such as constants or	C203.3	BTL1
variable name	es and the other nodes contain operators.		
18 What is a	threaded binary tree?		
A threade	d binary tree may be defined as follows: "A binary		
	ded by making all right child pointers that would	C203.3	DEL 1
	null point to the inorder successor of the node, and		BTL1
_	pointers that would normally be null point to the		
	cessor of the node		
	nt by binary search tree?		
	Search tree is a binary tree in which each internal		
_	an element such that the element stored in the left	C203.3	BTL2
	are less than or equal to x and elements stored in the		D112
	of x are greater than or equal to x .		
	vantages of threaded binary tree.		
	· ·		
	e between a binary tree and the threaded binary tree		
	binary trees the nodes are null if there is no child		
	th it and so there is no way to traverse back.		
	ided binary tree we have threads associated with the		
	v either are linked to the predecessor or successor in		
	aversal of the nodes.	C203.3	BTL5
	s to traverse further or backward in the in order		
traversal fash			
	two types of threaded binary tree :-		
, ,	'hreaded: - i.e. nodes are threaded either towards its		
	ecessor or successor.		
/	threaded: - i.e. nodes are threaded towards both the		
	ecessor and successor.		
	various representation of a binary tree?		
Tree Represen	ntation	C203.3	
Array represe	ntation	C203.3	BTL1
Linked list re	presentation		
22 List the appl	ication of tree.		
(i) Electrical (Circuit		
ii) Folder stru	cture	C203.3	BTL1

b. File index s			
c. Hierarchica	ıl database management system		
	y tree and give the binary tree node structure.	C203.3	BTL1

		Т	T
	a to the second of the second		
24	 What are the different ways of representing a Binary Tree? Linear Representation using Arrays. Linked Representation using Pointers. 	C203.3	BTL1
25	Give the pre & postfix form of the expression (a + ((b*(c-e))/f).	C203.3	BTL2
26	Define a heap. How can it be used to represent a priority queue? A priority queue is a different kind of queue, in which the next element to be removed is defined by (possibly) some other criterion. The most common way to implement a priority queue is to use a different kind of binary tree, called a heap. A heap avoids the long paths that can arise with binary search trees.	C203.3	BTL1
27	What is binary heap? It is a complete binary tree of height h has between 2 ^{h and} 2 ^{h+1} -1 node. The value of the root node is higher than their child nodes	C203.3	BTL1
28	Define Strictly binary tree? If every nonleaf node in a binary tree has nonempty left and right subtrees ,the tree is termed as a strictly binary tree.	C203.3	BTL1
29	Define complete binary tree? A complete binary tree of depth d is the strictly binary tree all of whose are at level d.	C203.3	BTL1
30	What is an almost complete binary tree? A binary tree of depth d is an almost complete binary tree if: Each leaf in the tree is either at level d or at level d-1 For any node nd in the tree with a right descendant at level d,all the left descendants of nd that are leaves are at level d.	C203.3	BTL1
31	Define AVL Tree. A AVL tree is a binary search tree except that for every node in the tree,the height of the left and right subtrees can differ by atmost 1.	C203.3	BTL1

	PART-B		
1	Define Tree. Explain the tree traversals with algorithms and examples.	C203.3	BTL5
2	Construct an expression tree for the expression $(a + b * c) + ((d * e + 1) * g)$. Give the outputs when you apply preorder, inorder and postorder traversals.	C203.3	BTL5
3	Explain binary search tree ADT in detail.	C203.3	BTL5
4	Explain AVL tree ADT in detail.	C203.3	BTL5
5	Explain b tree and B+ tree ADT in detail.	C203.3	BTL5
6	Explain Heap tree ADT in detail.	C203.3	BTL5
7	Explain threaded binary tree ADT in detail.	C203.3	BTL2

UNIT IV

NON LINEAR DATA STRUCTURES- GRAPHS

Definition-Representation of graph-types of graph-Breadth-first traversal-Depth-first-Traversal-Topological sort-Bi-connectivity-Cut vertex-Eulercircuits-Applications of graphs.

S. N o.	Question	Course Outcome	Blooms Taxanom y Level
1	Define Graph? A graph G consist of a nonempty set V which is a set of nodes of the graph, a set E which is the set of edges of the graph, and a mapping from the set for edge E to a set of pairs of elements of V. It can also be represented as G= (V, E).	C203.4	BTL1
2	Explain the topological sort. It is an Ordering of vertices in a directed acyclic graph such that if there is a path from vi to vj, then vj appears after vi in the ordering.	C203.4	BTL1
3	Define NP NP is the class of decision problems for which a given proposed solution for a given input can be checked quickly to see if it is really a solution.	C203.4	BTL1
4	Define biconnected graph. A connected undirected graph is biconnected if there are no vertices whose removal disconnects the rest of the graph.	C203.4	BTL1
5	Define shortest path problem? For a given graph G=(V, E), with weights assigned to the edges of G, we have to find the shortest path (path length is	C203.4	BTL1

	defined as sum of the weights of the edges) from any given source		
	vertex to all the remaining vertices of G.		
6	Mention any two decision problems which are NP-Complete.		
	NP is the class of decision problems for which a given	C203.4	BTL2
	proposed solution for a given input can be checked quickly to see		DILL
	if it is really a solution		
7	Define adjacent nodes?		
	Any two nodes which are connected by an edge in a graph are	C203.4	BTL1
	called adjacent nodes. For E is associated with a pair of	C203.1	DIE
	nodes \in example, if and edge x (u,v) where u, v V, then we say		
	that the edge x connects the nodes u and v. ∈		DEL 1
8	What is a directed graph?	C203.4	BTL1
0	A graph in which every edge is directed is called a directed graph.		
9	What is a undirected graph?	C203.4	DTI 1
	A graph in which every edge is undirected is called a directed		BTL1
10	graph. What is a loon?		BTL1
10	What is a loop?	C203.4	BILI
	An edge of a graph which connects to itself is called a loop or sling.		
11	What is a simple graph?		
11	A simple graph is a graph, which has not more than one edge	C203.4	
	between a pair of nodes than such a graph is called a simple	C203.4	BTL1
	graph.		
12	What is a weighted graph?		
12	A graph in which weights are assigned to every edge is called a	C203.4	BTL1
	weighted graph.		2121
13	Define out degree of a graph?	C202.4	BTL1
	In a directed graph, for any node v, the number of edges which	C203.4	
	have v as their initial node is called the out degree of the node v.		
14	Define indegree of a graph?	C203.4	
	In a directed graph, for any node v, the number of edges which	C203.4	BTL1
	have v as their terminal node is called the indegree of the node v.		
15	Define path in a graph?	C203.4	
	The path in a graph is the route taken to reach terminal	€20J.T	BTL1
1 -	node from a starting node.		
16	What is a simple path?	C203.4	DTI 1
	A path in a diagram in which the edges are distinct is called a	• •	BTL1
17	simple path. It is also called as edge simple.		
17	What is a cycle or a circuit?	C203.4	DTI 1
	A path which originates and ends in the same node is		BTL1
10	called a cycle or circuit.		
18	What is an acyclic graph? A simple diagram which does not have any cycles is called	C203.4	BTL1
	an acyclic graph.		DILL
19	What is meant by strongly connected in a graph?		
17	An undirected graph is connected, if there is a path from	C203.4	
	every vertex to every other vertex. A directed graph with this	C203.4	BTL1
	property is called strongly connected.		
	property to entire outstifty continuous.		<u> </u>

20	W) · 1 · 1 / 1 11 / 10		
20	When is a graph said to be weakly connected?	·	
	When a directed graph is not strongly connected but the	C203.4	BTL1
	underlying graph is connected, then the graph is said to be weakly		2121
	connected.		
21	Name the different ways of representing a graph?	C203.4	
	a. Adjacency matrix	C203.4	BTL1
	b. Adjacency list		
22	What is an undirected acyclic graph?		
	When every edge in an acyclic graph is undirected, it is	C203.4	DTI 1
	called an undirected acyclic graph. It is also called as undirected		BTL1
	forest.		
23	What are the two traversal strategies used in traversing a graph?	G202.4	
	a. Breadth first search	C203.4	BTL1
	b. Depth first search		
24	What is a minimum spanning tree?		
	A minimum spanning tree of an undirected graph G is a	C203.4	DTI 1
	tree formed from graph edges that connects all the vertices of G at		BTL1
	the lowest total cost.		
25	Define topological sort?		
	A topological sort is an ordering of vertices in a directed	C203.4	D 1
	acyclic graph, such that if there is a path from v_i to v_i appears after	C203.1	BTL1
	v_i in the ordering.		
26	What is the use of Kruskal's algorithm and who discovered it?		
20	Kruskal's algorithm is one of the greedy techniques to solve the	C203.4	
	minimum spanning tree problem. It was discovered by Joseph	C203.4	BTL1
	Kruskal when he was a second-year graduate student.		
27	What is the use of Dijksra's algorithm?		
21	Dijkstra's algorithm is used to solve the single-source		
	shortest-paths problem: for a given vertex called the source in a		
	weighted connected graph, find the shortest path to all its other	C203.4	BTL1
			ועוט
	vertices. The single-source shortest-paths problem asks for a		
	family of paths, each leading from the source to a different vertex in the graph, though some paths may have added in common		
20	in the graph, though some paths may have edges in common.		
28	Prove that the maximum number of edges that a graph with n		
	Vertices is n*(n-1)/2.		
	Choose a vertex and draw edges from this vertex to the	Gasa :	
	remaining n-1 vertices. Then, from these n-1 vertices, choose a	C203.4	BTL5
	vertex and draw edges to the rest of the n-2 Vertices. Continue this		
	process till it ends with a single Vertex. Hence, the total number of		
	edges added in graph is		
	(n-1)+(n-2)+(n-3)++1 = n*(n-1)/2.		
29	Define minimum cost spanning tree?		
	A spanning tree of a connected graph G, is a tree consisting of		
	edges and all the vertices of G. In minimum spanning tree T, for a	C203.4	
	given graph G, the total weights of the edges of the spanning tree	C203. 4	BTL1
	must be minimum compared to all other spanning trees generated		
	from GPrim's and Kruskal is the algorithm for finding		
	Minimum Cost Spanning Tree.		
	1 0		

cach other through an edge. In the following example, B is adjacent to A, C is adjacent to B, and so on. 31 Define Basic Operations of Graph. Following are basic primary operations of a Graph • Add Vertex – Adds a vertex to the graph. • Add Vertex – Displays a vertex of the graph. • Display Vertex – Displays a vertex of the graph. • Display Vertex – Displays a vertex of the graph. Level of a node represents the generation of a node. If the root node is at level 2, and so on. 33 What is visiting and traversing in graph. • Visiting refers to checking the value of a node when control is on the node. • Traversing means passing through nodes in a specific order. UNIT V

SEARCHING, SORTING AND HASHING TECHNIQUES

Searching –Linear searching-Binary searching. Sorting-Bubble sort-selection Sort-Insertion Sort-shell sort-Radix Sort. Hashing-Hash functions-Separate chaining-Open Addressing-Rehashing- Extendible hashing.

S. No.	Question	Course Outcome	Blooms Taxanomy
1	Define sorting Sorting arranges the numerical and alphabetical data present in a list in a specific order or sequence. There are a number of sorting techniques available. The algorithms can be chosen based on the following factors • Size of the data structure • Algorithm efficiency Programmer's knowledge of the technique	C203.5	BTL1
2	 Mention the types of sorting Internal sorting External sorting 	C203.5	BTL2
3	What do you mean by internal and external sorting? An internal sort is any data sorting process that takes place entirely within the main memory of a computer. This is possible whenever the data to be sorted is small enough to all be held in the main memory. External sorting is a term for a class of sorting algorithms that can handle massive amounts of data. External sorting is required when the data being sorted do not fit into the main memory of a computing device (usually RAM) and instead they must reside in the slower external memory (usually a hard drive).	C203.5	BTL1
4	How the insertion sort is done with the array? It sorts a list of elements by inserting each successive element in the previously sorted Sub list. Consider an array to be sorted A[1],A[2],A[n] a. Pass 1: A[2] is compared with A[1] and placed them in sorted order. b. Pass 2: A[3] is compared with both A[1] and A[2] and inserted at an appropriate place. This makes A[1], A[2],A[3] as a sorted sub array. c. Pass n-1: A[n] is compared with each element in the sub array	C203.5	BTL1

	A [1], A [2]A [n-1] and inserted at an appropriate position.		
5	Define hashing.		
	Hash function takes an identifier and computes the address of	C203.5	BTL1
	that identifier in the hash table using some function		
6	What is the need for hashing?		
	Hashing is used to perform insertions, deletions and find in constant	C203.5	
	average time.	C205.5	BTL1
	average time.		
7	Define hash function?	C203.5	BTL1
	Hash function takes an identifier and computes the address of that	C203.3	
	identifier in the hash table using some function.		
8	List out the different types of hashing functions?		
	The different types of hashing functions are,		
	a. The division method	~~~~	
	b. The mind square method	C203.5	BTL1
	c. The folding method		
	d. Multiplicative hashing		
	e. Digit analysis		
9	What are the problems in hashing?		
	a. Collision	C203.5	BTL1
	b. Overflow		BILI
10	What are the problems in hashing?		BTL1
10	When two keys compute in to the same location or address in	C203.5	BILI
	the hash table through any of the hashing function then it is termed	C203.3	
	collision.		
11	what is insertion sort? How many passes are required for the		
11	elements to be sorted?		
	one of the simplest sorting algorithms is the insertion sort. Insertion		BTL1
	sort consist of N-1 passes . For pass P=1 through N-1 , insertion	C203.5	
	sort ensures that the elements in positions 0 through P-1 are in		
	sorted order. It makes use of the fact that elements in position 0		
12	through P-1 are already known to be in sorted order.		
12	Write the function in C for insertion sort?		
	void insertionsort(elementtype A[], int N)		
	{ :		
	int j, p;		
	elementtype tmp;	G202 =	
	for(p=1; p <n;p++)< td=""><td>C203.5</td><td>BTL5</td></n;p++)<>	C203.5	BTL5
	{		
	tmp = a[p];		
	for (j=p; j>0 && a [j -1] >tmp; j)		
	a [j] = a [j-1];		
	a[j] = tmp;		
	}}		
13	Who invented shellsort? define it?		
	Shellsort was invented by Donald Shell . It works by comparing	C203.5	BTL1
	element that are distant . The distance between the comparisons		D11/1
	decreases as the algorithm runs until the last phase in which		

	adjacent elements are compared . Hence it is referred as		
	diminishing increment sort.		
14	write the function in c for shellsort?		
	Void Shellsort(Elementtype A[],int N)		
	{		
	int i, j, increment;		
	elementtype tmp;		
	for(elementtype=N / 2;increment > 0;increment / = 2)		
	For $(i = increment; i < N; i ++)$		
	{	C203.5	BTL5
	tmp=A[];		DILS
	for(j=I; j>=increment; j - =increment)		
	if(tmp $<$ A[]=A[j – increment];		
	A[j]=A[j-increment];		
	Else		
	Break;		
	A[j]=tmp;		
	}}		
15	ferentiate between merge sort and quick sort?		
	Mergesort quick sort	C203.5	BTL4
	1. Divide and conquer strategy Divide and conquer strategy		BILI
	2. Partition by position Partition by value		
16	Mention some methods for choosing the pivot element in quick		
	sort?	C203.5	
	1. Choosing first element	C203.3	BTL2
	2. Generate random number		
	3. Median of three		
17	What are the three cases that arise during the left to right scan		
	in quick sort?	C203.5	
	1. I and j cross each other	C203.3	BTL1
	2. I and j do not cross each other		
	3. I and j points the same position		
18	What is the need of external sorting?		
	External sorting is required where the input is too large to fit into	C203.5	BTL1
	memory. So external sorting Is necessary where the program is too		2121
	large		
19	What is sorting?		
	Sorting is the process of arranging the given items in a logical	C203.5	BTL1
	order. Sorting is an example where the analysis can be precisely		
	performed.		
20	What is mergesort?	C203.5	
	The mergesort algorithm is a classic divide conquer strategy. The	C203.3	BTL1
	problem is divided into two arrays and merged into single array		
21	Compare the various hashing techniques.		
	Technique Load Factor	C203.5	_
	Separate chaining - close to 1	C203.3	BTL2
	Open Addressing - should not exceed 0.5		
1	Rehashing - reasonable load factor		

22	Define collision in hashing.		
	When two different keys or identifiers compute into the same	C203.5	D 1
	location or address in the hash table through any of the hashing	C203.5	BTL1
	functions, then it is termed Collision.		
23	Define Double Hashing.		
	Double Hashing is a collision-resolution technique used in open		
	addressing category. In double hashing, we apply a second hash	C203.5	BTL1
	function to x and probe at a distance of hash2 (x),		
	2hash2 (x), and so on.		
24	What are applications of hashing?		
	The applications of hashing are,		
	 Compliers use hash table to keep track of declared variables 		
	on source code.	C203.5	BTL1
	 Hash table is useful for any graph theory problem, where 		DILI
	the nodes have real names instead of numbers.		
	 Hash tables are used in programs that play games. 		
	 Online spelling checkers use hashing. 		
25	What does internal sorting mean?	C203.5	
	Internal sorting is a process of sorting the data in the	C203.3	BTL1
	main memory		
26	What are the various factors to be considered in deciding a		
	sorting algorithm?		
	Factors to be considered in deciding a sorting algorithm are,	C203.5	
	1. Programming time	C203.0	BTL1
	2. Executing time for program		
	3. Memory or auxiliary space needed for the programs		
27	environment.		
27	How does the bubble sort get its name?	C203.5	DEL 1
	The bubble sort derives its name from the fact that the		BTL1
20	smallest data item bubbles up to the top of the sorted array.		
28	What is the main idea behind the selection sort?	C202.5	
	The main idea behind the selection sort is to find the smallest entry among in $g(i)$ $g(i+1)$ and then interchange it with $g(i)$	C203.5	BTL1
	among in a(j),a(j+1),a(n) and then interchange it with a(j).		
29	This process is then repeated for each value of j. Is the heap sort always better than the quick sort?		
29	No, the heap sort does not perform better than the quick sort.		
	Only when array is nearly sorted to begin with the heap sort	C203.5	BTL4
	algorithm gains an advantage. In such a case, the quick deteriorates		DIL#
	to its worst performance of O (n2).		
30	Name some of the external sorting methods.		
30	Some of the external sorting methods are,		
	1. Polyphase sorting	C203.5	BTL2
	2. Oscillation sorting		- · · · ·
	3. Merge sorting		
31	Define radix sort		
	Radix Sort is a clever and intuitive little sorting algorithm.	C203.5	BTL1
	Radix sort is a on comparative integer sorting algorithm that sorts		
	1 50. 2 50.10		

		1	
	data with integer keys by grouping keys by the individual digits which share the same significant position		
32	Define searching Searching refers to determining whether an element is present in a given list of elements or not. If the element is present, the search is considered as successful, otherwise it is considered as an unsuccessful search. The choice of a searching technique is based on the following factors a. Order of elements in the list i.e., random or sorted b. Size of the list	C203.5	BTL1
33	Mention the types of searching The types are Linear search Binary search	C203.5	BTL2
34	What is meant by linear search? Linear search or sequential search is a method for finding a particular value in a list that consists of checking every one of its elements, one at a time and in sequence, until the desired one is found.	C203.5	BTL1
35	What is binary search? For binary search, the array should be arranged in ascending or descending order. In each step, the algorithm compares the search key value with the middle element of the array. If the key match, then a matching element has been found and its index, or Position, is returned. Otherwise, if the search key is less than the middle element, then the algorithm repeats its action on the sub-array to the left of the middle element or, if the search key is greater, on the sub-array to the right.	C203.5	BTL1
36	What are the collision resolution methods? The following are the collision resolution methods • Separate chaining • Open addressing • Multiple hashing	C203.5	BTL1
37	Define separate chaining It is an open hashing technique. A pointer field is added to each record location, when an overflow occurs; this pointer is set to point to overflow blocks making a linked list. In this method, the table can never overflow, since the linked lists are only extended upon the arrival of new keys.	C203.5	BTL1
38	What is open addressing? Open addressing is also called closed hashing, which is an alternative to resolve the	C203.5	BTL1

	Collisions with linked lists. In this hashing system, if a collision occurs, alternative cells are tired until an empty cell is found. There are three strategies in open addressing: • Linear probing • Quadratic probing • Double hashing		
39	What is Rehashing? If the table is close to full, the search time grows and may become equal to the table size. When the load factor exceeds a certain value (e.g. greater than 0.5) we do Rehashing: Build a second table twice as large as the original and rehash there all the keys of the original table. Rehashing is expensive operation, with running time O(N) However, once done, the new hash table will have good performance.	C203.5	BTL1
40	What is Extendible Hashing? Used when the amount of data is too large to fit in main memory and external storage is used. N records in total to store, M records in one disk block The problem: in ordinary hashing several disk blocks may be examined to find an element - a time consuming process. Extendible hashing: no more than two blocks are examined.	C203.5	BTL1
	PART -B		
1	Explain the sorting algorithms	C203.5	BTL2
2	Explain the searching algorithms	C203.5	BTL5
3	Explain hashing	C203.5	BTL5
4	Explain open addressing	C203.5	BTL5
5	Write a C program to sort the elements using bubble sort, insertion sort and radix sort.	C203.5	BTL5
